Abstract (Basic): RD 193032 A

Fabrics are chemically treated to impart desirable physical properties, including water repellency, anti-soil and anti-static behaviour. The chemical treatment, or coating may be applied to one or both sides of the fabric. Chemical incompatibility arises when, e.g. an anti-static agent and a water repellent are combined in a single coating compsn.

This has been avoided by coating one side of the fabric with the water repellent formulation, and the opposite side with an anti-static agent. The fabric is then wound on a long core. The anti-static agent migrates from the side on which it was originally applied to the contacting water repellent side, giving acceptable and essentially equiv. anti-static protection to both sides of the coated fabric.
